

Clarity that scales.

A shared foundation for Artera’s
next chapter.

Mike Jerugim Design Lead

I started with stories. I design for understanding.

WHERE I STARTED

Film & TV post-production.
Recording artist at Interscope.

Sequence, emphasis, arc.
Knowing what someone needs to understand next.

This work is personal to me, too.

MOST RECENTLY

Kooth / Soluna

Consumer apps and practitioner tools.
A design system, clinical trust, medical-device work.

Onix

Consumer and expert experiences.
One foundation across product, brand, and code.

Both within HIPAA and SOC 2 requirements. Privacy built into the work, not added after.

“How will you audit our current products to find what needs fixing?”

ARTERA’S PROBLEM

Every report and screen was built for the moment it was needed. Nobody holds the full inventory.

MY SOLUTION

- 01 **Inventory every surface.**
Reports, portal, lab-facing, Figma, code.
- 02 **Let the code answer first.**
Claude Code lists every component and one-off in days.
- 03 **Watch the work, then score it.**
Harm, frequency, rework, commercial weight.

THIRTY DAYS

A map of duplication and risk, and the first win.

“What is your framework for setting up design tokens?”

Three tiers. Meaning kept out of the paint.

What clinicians see rests on decisions that should never be reinvented per product.

- Production code
- Figma variables
- Style Dictionary

Context	Brand · product · locale
Semantic	Action · surface · status · clinical schema
Primitive	Colour · type · space · motion

A design-system metaphor, not a model of AI inference.

Three tiers. One source.

Clinical meaning in schemas, not paint.

ARTERA’S PROBLEM

A “positive” biomarker cannot be just a green.

THE FRAMEWORK

- 01

Primitive.

Raw values. No opinions.
- 02

Semantic.

Intent, not colour.
- 03

Clinical schema, not tokens.

Meaning owned with science, rendered through the system.
- 04

Theme layers.

Brand, product, locale. One source, every platform.

At Onix, Anvil’s tokens ran the app, the sites, and Storybook from one source.

“How will you ensure accessibility and company-wide understanding of the design system?”

ARTERA’S PROBLEM

Reports get printed, faxed, and read under regulatory scrutiny. The people who need the system are not only designers.

MY SOLUTION

- 01 **WCAG 2.1 AA is the floor.**
Aligned to FDA human factors.
- 02 **Risk is never colour alone.**
- 03 **One documentation site everyone reads.**
Storybook as the living reference.

“How will you align Designers, Product Managers, and Engineers?”

ARTERA’S PROBLEM

When a one-off breaks, design gets the blame.

MY SOLUTION

01 **One vocabulary before pixels.**

02 **Tokens are the contract.**

03 **Design in the codebase.**
Handoff is a pull request, not a PDF.

- Figma Make
- Google Stitch
- Claude Code
- Production code

“What does your governance model look like?”

ARTERA’S PROBLEM

Nobody owns cross-cutting decisions. Clinical claims need a review path that exists.

MY SOLUTION

- 01 **A five-person council.**
Design, engineering, product, science, commercial.
- 02 **A contribution path.**
Propose, review, pilot, release.
- 03 **Three tiers of change.**
Patch ships. Minor to council. Major adds science sign-off.

PROOF · THE COUNCIL I ESTABLISHED AT KOOTH

Governance

Ran weekly meetings with designers, researchers, and engineers.

Contribution

Created the contribution model and documentation framework.

Craft

“How will you handle disagreements between teams regarding system updates?”

ARTERA’S PROBLEM

Science wants nuance. Commercial wants simplicity. Engineering wants reuse. All three are right.

MY SOLUTION

- 01 Patient safety and clinical accuracy
- 02 Regulatory and privacy
- 03 Accessibility
- 04 Consistency and reuse
- 05 Velocity
- 06 Preference

Higher wins. Missing evidence gets a time-boxed pilot, not a longer meeting.

“How will you convince product teams to stop using their old workflows and adopt the new design system?”

ARTERA'S PROBLEM

The old way feels faster because it is familiar. Nobody funds migration.

MY SOLUTION

- 01

Earn the first team.
The bladder report, shipped faster on the system.
- 02

Make it the fastest path.
Examples, office hours, AI-assisted migration.
- 03

Fund it inside product work.
After version one, no new one-offs.

“How will the system scale as the company grows and launches new products?”

ARTERA’S PROBLEM

Breast is live. Bladder is coming. Labs will run the test inside Epic and Cerner.

MY SOLUTION

- 01

Products.

An indication is a pack, not a new system.
- 02

Brands.

A lab’s identity is a theme layer.
- 03

Hosts and locales.

Components that survive an EMR. Meaning that survives translation.

Epic · Orders

ArteraAI Prostate Test

Specimen on file · 22-00129

Order test

“What key performance indicators or metrics will you track to prove the design system is working?”

ARTERA’S PROBLEM

Without a baseline, every improvement is an anecdote.

MY SOLUTION

Baseline first, targets second. Six numbers, the same way every quarter.

Delivery	Lead time for a comparable change
	Less repeated effort
Adoption	Share of eligible work on shared patterns
	Reuse that actually happens
Quality	Design-attributed defects per release
	The number engineering stops arguing about
Comprehension	Clinician time-to-answer on the real report
	Can a rad onc find the ST-ADT result in ten seconds?

“How will you communicate the return on investment to executive leadership to secure long-term funding?”

ARTERA’S PROBLEM

A design system is invisible when it works.

MY SOLUTION

- 01

One page, quarterly.
Shipped, used, improved, next.
- 02

Effort into cost.
Hours returned, assumptions visible, maintenance included.
- 03

Fund in phases.
Each quarter earned by the last.

The leadership update

What shipped → who uses it → what improved → what’s next

Understand. Prove. Scale.

Days 1–30	Understand the work Decision: where to start	Audit, observe, baseline.
Days 31–60	Prove a thin slice Decision: what holds up	Bladder report on the system. Council live.
Days 61–90	Scale what works Decision: what to invest in next	Measure, refine, scale to the next context.

Start with your teams. Choose a pilot. Prove the value together.
